RESPONSIBLE

Kris Timmermans, Accenture Global Supply Chain Lead:

And so, let's take a zoom in on environmental sustainability.

And so, it comes with no surprise that it starts with supply chain: emissions in supply chain are in average 5.5 times that the rest of the organization.

Actually, I was talking about six industries that generate almost 50% of the emissions.

Each one of those industries actually have scope 3 emissions of more than 80% out of their total emissions.

And if you look at scope 1, so emissions from your own operations, scope 2 – emissions that come from your energy usage - our clients have a path to success there towards the promises that they've made.

For example, in renewable energy, there's no trade-off anymore.

It became more cost-effective to go renewable than before.

So, you know, it's easier to find that path.

In scope 3 however, that's where people are struggling.

And it is an important element.

It's actually through scope 3 that you can fundamentally change the behavior of your suppliers and you can create a positive ripple effect in so many countries in the world, even countries that are falling behind in terms of regulation.
